Abstract (en)
[origin: EP0863290A2] Couplings (3) between separate blinds forming a blind arrangement can be connected to a centrally driven continuous shaft. The shafts of individual blinds have journals (11) extending beyond the ends. Each coupling is in the form of a flange and has a mounting ring at the edge for centring the journal. The mounting ring is divided into two half rings (31, 32), one of which (32) is one piece with the coupling while the other (31) can be removed radially and can be fastened to the coupling. Preferably the shaft journals are in the form of caps (10) which can be fitted axially into the shafts of the individual blinds.
