Abstract (en)

A stereoscopic film slide and a viewer are disclosed. The slide (22) comprises a carrier (140) and a plurality of pairs of stereoscopic photographic transparencies (142) arranged in two superposed rows in which the transparencies in the respective rows are inverted with respect to one another so that one of the rows can be viewed in a slot (48) in the viewer (20) in which the slide (22) is longitudinally displaceable and the second row of transparencies can be viewed with the slide (22) in a second position in the viewer in which the slide is inverted compared to its first position. The viewer (20) is assembled from a cardboard blank (52) and includes front and rear portions (24 and 26, respectively) defining therebetween a slot (48) to receive the slide (22). The slot (48) has open ends and an open top and the rear portion (26) of the viewer is displaceable rearwardly to open the slot (48) to a generally V-shaped configuration for insertion of the film slide (22) into and removal thereof from the slot. The rear portion (26) of the viewer is maintained in its normal position by an elastic tension member (132) which extends diagonally of said portion.
