Abstract (en)

[origin: CA1111149A] The present invention relates to a process for passivating the surfaces of semiconductor elements. Silicon layers which are vapourdeposited on the surface of semiconductor elements have the effect of a permanent stability on the characteristic curves of the semiconductor element. These silicon layers are annealed, in order to reduce the inverse currents. This effects a permanent lowering of the inverse-current level. This invention may be used on all semiconductor elements.
