Abstract (en)

[origin: DE19537571A1] In a coil holder (H) for a coil frame (C), with a sleeve body (15) securable on a frame rod (1 to 4, 11) on which a concentric ring socket (19) is fitted to rotate and securable in at least one p redeterminable rotary position by a releasable elastic catching device (F), a bearing block (20) with a recess (A) for the coil core (9) fitted on the ring socket (19) and a threaded drilling (23) opening in the bearing block (20) into the recess (A) for a securing screw, there is in the bearing block (20) a drilling (24) open at both ends and circumferentially closed forming the recess (A) with its axis (25) running transversely to the axis of the ring socket (19) and a central longitudinal section (M) at least partly passing through the ring socket (19), the length of the drilling (24) is approximately the same as the outside diameter of the ring socket (19) and the threaded drilling (23) is directed from the outside approximately radially on the ring socket axis.
