Abstract (en)

[origin: WO9929198A1] The present invention provides a method for manufacturing multi-layered garments comprising the steps of aligning layers where at least one is coated with a temporarily fusible adhesive, fusing layers, carrying out at least one conventional manufacturing step, applying heat or a combination of heat and pressure to dissipate the adhesive wherein the adhesive is a low molecular weight adhesive which exhibits a rapid decrease in viscosity upon heating. Therefore, the adhesive will flow away from the glue line, mainly into a base fabric of interlining. Preferably the step of applying heat comprises steam pressing fused fabrics or finished garments.
