Abstract (en)

[origin: WO9839744A2] The invention relates to a data carrier, especially a chip card, which is designed to acquire and memorize data records representing the acquired authorizations through a security module. The data records are respectively subdivided into a first zone with a specific data structure which is to be used by the users of a specific authorization system using the data carrier, and a second freely recordable zone whose data structure can be individually selected by users. The invention also relates to a method for memorizing said authorizations.
