Abstract (en)

[origin: WO0249909A1] The invention concerns a device for varying the capsizing torque of a multihull (12) consisting of at least two floaters (9) linked together by at least two beams respectively called front link beam (8) and rear link beam (6). The invention is characterised in that it comprises a geometrical platform (15) supporting a masting (1) and a crew dinghy (10) and said platform (15) is mounted transversely sliding on the multihull (12) to enable, depending on the equilibrium desired by the crew, the displacement of the masting (1) and the crew dinghy (10) from one side to the other of the multihull (12). The invention also concerns a multihull equipped with such a device.
