Abstract (en)

[origin: WO9844867A1] The invention relates to a divided dental pin arrangement with a construction (10) which can be crowned. The inventive arrangement has at least one retention pin (12) for fixing the construction (10) to the root (14) of the tooth. The at least one retention pin (12) has an outer thread (16) and is screwed into the tooth root (14) essentially horizontally in the area of the root canal (18), so as to connect said retention pin (12) and said tooth root (14) in such a way that they are detachable. The construction for capping (10) is supported in the upper root area (20) by the retention pin (12) screwed into the tooth root (14). Said retention pin (12) extends through a continuous bore (22) in the construction (10), said bore (22) having a shoulder (24) in which the head (26) of the retention pin (12) engages, so as to connect the retention pin (12) and the construction (10) in such a way that they can be detached.
