Abstract (en)

Cardiac and vascular prostheses and methods of making the same. The prostheses are suitable for implantation in a bloody environment. The prosthesis includes a surface material adapted for exhibiting a regular and periodic surface charge characteristic in the bloody environment (See Fig. 1A: scanning electron micrographs of an albumin Dacron hybrid graft). A prosthesis means supports the surface material and is adapted to perform a prosthetic function in the bloody environment. In cases where cross-linking is desired and the surface material cannot cross-link with the substrate material, an adaptive material is provided which cross-links both to the surface material and to the material of the prosthesis.
