Abstract (en)

[origin: WO9900048A1] A drying and/or cleaning apparatus comprises a roll (11) of absorbant sheet material removably mounted on a handle (120), the roll being rotatable relative to the handle to enable different regions of the exterior surface of the roll to engage a surface to be dried and/or cleaned. The material has transverse lines of weakness (14) at intervals along its length to allow successive individual sheets of the material to be torn off when they are soiled. An adhesive is provided on the material to mitigate against the roll becoming inadvertently unwound. As shown, the adhesive may take the form of one or more lines (104) of adhesive extending along the length of the material on the roll, or individual transverse lines of adhesive (not shown) each just upstream of a respective line of weakness (14). The adhesive is sufficiently weak to permit soiled material to be removed from the exterior surface of the roll.
