Abstract (en)

[origin: WO0229185A1] The invention relates to a tool for releasing a locking cylinder, which has, as the tumbler, a plurality of spring-loaded locking bodies that can be displaced transversally in relation to the rotational axis of the locking cylinder. Said tool comprises a rotative part (1), whose end nearest the cylinder is provided with two follower noses (10) that can be introduced into the keyway and a sliding part (4) that is mounted on the rotative part (1) in a positive fit in the direction of rotation and that can be displaced axially in the axial direction. The end of said sliding part nearest the cylinder is provided with a flat key element (6), whose cross-sectional profile corresponds at least partially to the cross-sectional profile of the keyway and on which at least one key body (9) for displacing the locking body in the locking cylinder is provided.
