Abstract (en)

[origin: WO0163691A1] The invention relates to a fixing element for a focusing component (1), said component (1) being fixed by connecting elements to an object and having components (2, 3, 4) which can be focused on a predetermined signal axis. A fixing plate (5) with flexible flaps (6, 7) is attached between the component (1) and the object onto which said component is to be fixed. The flexible flaps provide the mechanical contact between the component (1) and the object, thus permitting the height tolerances of the component (1) to be compensated during operation.
