Abstract (en)

[origin: WO03064746A2] The invention relates to the processing of a layer of parallel threads which are tensed in tensing means, wherein the sequence of the processing of the threads can be varied. According to the invention, a storage device for intermediate storage of at least one thread which can be separated from the layer of threads is provided. Said storage device comprises storage means consisting of at least one receiving element for holding one or several tensed threads. The at least one receiving element is arranged outside the plane of the layer of threads. The storage device also comprises at least one means for transferring the thread to the storage means.
