Abstract (en)

[origin: WO2005037695A2] A device for laying a flexible material web (1) has at least one pair of deposit rollers (2, 3) that rotate in opposite directions, it being possible to supply the material web (1) to at least one point of deposit (4) by means of the deposit rollers (2, 3). The deposit rollers (2, 3) form part of a deposit carriage (5) movable in a reversible direction over at least the deposit length (L) of the material web (1), making a higher production speed possible. The device is more cost-effective in that the deposit carriage (5) has a smaller width than the point of deposit (4) and is movable in a reversible direction over at least the deposit width (B) of the point of deposit (4).
