Abstract (en)

[origin: WO2009046907A2] The invention relates to a device for analyzing a dive, comprising at least one first arithmetic unit which is intended to be carried by a scuba diver during a dive. The first arithmetic unit is connected to at least one sensor that detects dive-specific parameters. The second arithmetic device comprises a memory device in which dive-specific data can be stored, the first and the second arithmetic unit comprising respective data communication devices. The arithmetic units communicate temporarily with each other to transfer dive-specific data from the first to the second arithmetic unit.
