Abstract (en)

[origin: WO2018024651A1] The invention relates to a package (100) for holding a pouch (150), and to a method to assemble the package. The package comprises a first main panel (102), a first side panel (104), a second main panel (106), a second side panel (108), arranged to define a tube¬ like body (109), and a bottom flap (118) hingedly connected to the first main panel. The first main panel comprises a first slit line (120) defining a first tongue (122), and the bottom flap comprises a second slit line (126) defining a second tongue (128). The bottom flap is folded towards the inside of the tube-like body so that the bottom flap contacts the inner surface (114) of the first main panel and the first and second slit lines substantially overlap. The first and second tongues jointly define a double layered tongue (130) adapted to be pushed to the inside of the tube-like body to form a double layered support tongue for receiving and holding the pouch.
