Abstract (en)

In a method for connecting a connector to a shielded cable, the cable having a plurality of wires, a common shielding and an outer jacket, the wires and the shielding are exposed at one end of the cable. A first sleeve-like body is provided on the outer jacket near the exposed shielding and the exposed shielding is laid on the first body. A second sleeve-like body is mounted on the first body to thereby clamp the exposed shielding between both bodies. The first body is mounted on the outer jacket by crimping an axial section of the first body at its end directed away from the exposed shielding, and the second body is crimped on the first body with an axial section at its end adjacent the exposed wires covering at most the non-crimped section of the first body. <IMAGE>
