Abstract (en)
[origin: EP0003471A1] The rigid vertical holder is fixed to a building wall so as to accommodate a radiator element. The lower end (4b) of the holder extends away from the wall and terminates in a round-section groove (6) accommodating the flat horizontal portion (2) of the element (1). The upper end pref. includes a bar, extending horizontally from the wall, and with a spring steel component (6) fixed to its outer end and extending upwards. The component is bent so as to form a horizontal part parallel with the bar, and one or more upright parts (10), also an end portion bent into an inverted U. The arms of the U are of unequal length, the outer one being shorter and pref. bent back towards the inner one.
