Abstract (en)

[origin: WO9901554A1] Novel mammalian secretory polypeptides, polynucleotides encoding the polypeptides (called Zsig9), and related compositions and methods including antibodies and antiidiotypic antibodies. Overexpression of these proteins is indicative of the presence of cancer. Antibodies and antisense nucleotides can be used therapeutically to treat the disease. Furthermore, antibodies to Zsig9 and nucleotide primers and probes can be used to diagnose the presence of tumors.
