Abstract (en)

[origin: FR2765980A1] The invention concerns a system for local or remote switching on and off of computers and/or peripherals with differentiation of local and remote switching-on mode and switching-off software, enabling to switch on a computer (4) and/or all or part of its peripherals (5) manually by the user or by sensing a calling signal coming through a digital or analog communication network (20), whether or not there is a communication interface powered or not (5), without requiring previous put through call. Said two switch-on modes are differentiated by the operation of software means particular to the system and permanently available on the computer. The switching-on mode signal is permanently available. The switching-on of certain peripherals can be made conditional to the local or remote switching-on mode. The invention enables to switch off a computer (4) and all or part of its peripherals (5) by operating software means particular to the system and permanently available. Said software means can be automatically or manually activated, either locally or remotely.
