Abstract (en)

"This invention relates to a hearing aid of the kind which is provided with a cylindrical battery holder. A hearing aid, in particular a "behind-the-ear" hearing aid, provided with a cylindrical battery holder which in a specific position permits a battery to be inserted radially and is rotatably journaled in a housing the battery holder extending partly outside the outer wall of the housing and being provided with a switch which switches on the associated amplifier upon rotation of the battery holder, which battery holder is coupled to the volume control of the amplifier. The volume control may comprise a single annular carbon track or a plurality of conductive contact tracks, which tracks may be arranged either on one of the flat side walls of the battery holder or outside said holder.
