Abstract (en)
[origin: EP0005119A1] 1. A stopping device of the so-called capsule type, comprising a threaded cap which is screwed onto the neck (2) of the flask (1) and an embellisher (15) connected to the cap which, in stopping position, has to have a determined orientation relative to the flask comprising an orientation element for the stopper (6, 26) fixed in rotation relative to the flask but partially disconnected from said flask in axial displacement and carrying a radial abutment (9, 29, 30) provided by a longitudinal nesting interlocking between the orientation element and a portion of the stopper, said abutment cooperating at the end of the screwing stroke with a radial abutment (16, 31) connected with the cap, wherein the orientation element of the stopper (6, 26) is resiliently biased (14, 27) towards the cap.
