Abstract (en)

[origin: WO0176405A1] The present invention relates to a carrying case capable of housing the computer during use. A flap arranged in the front wall of the carrying case may be opened whereby the computer is revealed and ready for use. The openable flap in the front wall is hinged to the lower part of the front wall, whereby said flap is capable of being opened to an opening angle in a range between 0 degree and 175 degree and capable of keeping said opening angle or a smaller angle when the opening force is removed. Thereby the flap cannot fall to a position behind the computer taking up extra space. Preferably the flap is provided with closing means whereby the flap will close automatically when an opening force is removed from the flap. In use the computer top part may be opened to reveal the keys and the display is arranged in the angle suitable for the actual user, whereby the flap is opened to a position having a substantially identical opening angle not falling to a table behind the computer.
