Abstract (en)

[origin: WO0222939A2] The invention concerns a flash iron comprising a water reservoir (2), a flash chamber (32) and a drip device having an axially mobile rod (4) whereof the total stroke comprises a first travel enabling the steam to flow towards the orifice (520) of a module (5) and a second travel moving the module (5) by opening a wider orifice (220) for water passing from the reservoir (2) to the flash chamber (32). The invention is characterised in that the tightness between the reservoir (2), the module (5) and the flash chamber (32) is provided by a first compressed seal, and the tightness between the rod and the module is provided by a second compressed seal, the two seals being parts of one and the same elastomeric component (52) borne by the module (5).
