Abstract (en)
Stacking apparatus for stacking banknotes or other sheets includes a single slotted-wheel (14) that is rotated to receive sheets (N) fed successively thereto. The sheets are retained in slots (13) of the wheel (14) so as to be carried round with the wheel (14) into abutment with stripper means (16) which dislodges the sheets from the slots (13) so that they stack one upon the other (S). The stripper means has abutments on both sides of the single wheel (14), and may be a plate (16) which is slotted to extend up on both sides of the wheel to provide said abutments and which also provides an abutment against which the stripped sheets fall in register upon one another in orderly stack (S). The wheel (14) may be a plastics moulding with the slots defined by individual curved-tines (19) moulded as one with the remainder of the wheel, and may be mounted centrally of the sheet-feed path.
