Abstract (en)

The invention provides plant for the filling of individual containers with liquid. A filling machine has a plurality of filling heads which move round an endless path with the containers as they are being filled, and there are at least two output paths from the endless path, respectively for different types of container. At least one, and usually each, outlet path leads to a capping or sealing machine of a type suited to the filled containers being delivered along that path to the capping or sealing machine.
