Abstract (en)

[origin: WO2005119381A1] The invention relates to a system which is used to operate partial units of a technical installation by editing graphic objects, said system comprising a graphic editor and a data editor. During the selection of a graphic object by means of a graphic editor, a data editor, which produces or modifies the control and configuration data and signals for a technical installation which is to be controlled, is called. The selection of the user is examined, in relation to the plausibility and consistency thereof, for the predetermined operational state of the technical installation. Subsequently, the modified and current configuration data is visualised in the graphic editor and the graphic object is modified based on the graphic object selected by the user.
