Abstract (en)
[origin: EP0007215A1] Carton forming apparatus comprises unitary corner element erecting devices (9) which are independently movable within the frame of the apparatus. The erecting device (9) include pressure plates (24) operable by piston and cylinder units (22) for applying pressure to the overlapping portions of an erected corner portion to cause an adhesive to become effective. In another embodiment a signal pressure plate is common to two of the corner forming devices (9). The particular combination of features of the apparatus allows for the manufacture of an effective carton forming apparatus at low cost and also allow ready adaptation of the apparatus to cartons of different sizes.
