Abstract (en)

Techniques for providing a play field reel glass enhancement on a gaming machine with mechanical spinning reels. A plurality of mechanical spinning reels are configured to indicate a gaming outcome for a wager game played on the gaming machine by a player. A light board located in front of the plurality of mechanical spinning reels lights up individual or groups of the light emitting elements. A graphic element on a reel glass is placed in front of the light board, creating the play field reel glass enhancement that is backlit by the light board to indicate gaming information to a player. A touch screen may be communicatively coupled with the reel glass to receive game input from the player, thereby making the play field reel glass enhancement interactive.
