Abstract (en)

[origin: WO2012174450A2] Systems and methods for providing graphical information regarding one or more patients' medical information are described. The graphical information can be used in various methods of graphical comparison, including graphical diagnoses, graphical comparison between patients, over time with a single patient, and/or over time with and/or between multiple patients. The graphical information can be used in place of and/or in conjunction with existing methods and systems for conveying medical information, including one or more textual methods and systems. The graphical information is provided electronically to any electronic or computer device or is provided in hard copy, such as a part of a patient's chart. The use of graphical patient medical information permits rapid and improved conveyance of information, and improves recognition and understanding of the most relevant medical information.
