Abstract (en)
[origin: EP0009157A1] 1. Pressure relieving facade for buildings endangered by sudden pressure differences consisting of tabular wall element (1) which are attached by holding means along their border areas (1a) on the side facing the building in such a way that they detach themselves at a given internal pressure, characterized in that the tabular wall elements (1), preferably the portions of parapets which lie below the windows, are provided with a circumferential holding piece (5) arranged vertically to the facade plane along their border area (1a) on the side facing the building, the free end of which piece goes over into a thickened clamping ledge (7) which is pushed into an undercut clamping slot (8) of a profile (9) of synthetic material fixed to the facade and is held there detachably in an elastic form-lock.
