Abstract (en)

[origin: EP0009885A1] A process for producing coated substrates having controllable surface texture. The coating composition is deposited on a carrying web (200) to which the coating will not adhere (e.g. polyester film). The substrate (100) to be coated (e.g. paper) is subsequently brought into contact with the coated web material and the laminate (201) passed through a curing station (7) where the coating composition is polymerized and cured. Upon removal from the curing station the substrate with the coating adhering to it can be released from the carrying web. The web can, if desired, be reused in the process.
