Abstract (en)

[origin: EP0011333A1] Detergent-compatible antistatic compositions produced by the at least partial complexing of certain anionic complexing components and quaternary ammonium compounds are described. The complex formed, which is relatively water-impenetrable and insoluble, constitutes at least 25% and preferably 50%-100% of the surfaces of the particulate detergent additive. These compositions provide static control benefits in laundering operations at reduced antistatic levels.
