Abstract (en)

[origin: EP0012455A1] 1. Contact device for the connection of electrical cable conductors with bus-bars and comprising contact fingers (42) which are resiliently (54) pressed towards each other and disposed in a plastics housing characterised in that a contact finger pair (42) is integrally formed at one end of a connecting lug (14), produced from a flat strip material, and the cable conductor (28) can be secured to the other end of the connecting lug, that a one-part housing (12) is associated with the connecting lug and comprises at its sides means (64, 66, 68, 72; 70; 74) by which it can be detachably connected to adjacent, like housings, and that the connecting lug is held in the housing by means of a holding element (16), which penetrates at least one opening (75, 77) in the housing and at least one recess (58) in the connecting lug.
