Abstract (en)

[origin: EP0012687A1] 1. Method of processing a vegetable raw material by means of an extracting agent for extracting therefrom the constituents soluble in said agent, said method consisting in : loading the raw material in bulk into the extracting agent ; performing a strong stirring and/or crushing of the raw material for dispersing it within the extracting agent and carrying out the dissolving of the soluble constituents of the raw material therein to thereby form a miscella, characterized in that substantially at the same time as said stirring and crushing, the miscella is filtered and fed to a separation zone wherein the miscella is treated for separating, from the extracting agent, the soluble constituents which are collected, the amount of filtered miscella being possibly compensated for by the batch of pure extracting agent.
