Abstract (en)

[origin: EP0014384A1] 1. A process for the uniform tone-in-tone dyeing of textile woven or knit fabrics made from mixtures of cellulose fibres and synthetic polyamide fibres according to the exhaust method from a single bath with water-insoluble azo dyestuffs formed on the fibre from coupling component and diazo component in the form of a stabilized diazonium compound, in which the dyestuff components are applied, at least partly in successive manner, under alkaline conditions and dyestuff development is caused by the action of acid, which process comprises using as the diazo component a water-soluble diazoamido compound obtained from a diazotized aromatic or heterocyclic amine and cyanamide, treating the textile goods at temperatures ranging of from 65 degrees to 75 degrees with an aqueous liquor containing the dissolved diazo component and a protective colloid, subsequently cooling down said liquor together with the impregnated textile good to temperatures ranging of from 30 degrees to 45 degrees C and further treating the same at the said decreased temperature, while simultaneously adding in portions the dissolved coupling component in the course of the both phases of the dyeing operation performed at the different temperature ranges, and finally effecting the acid treatment, which is necessary for liberating the diazonium compound and coupling, without change of the liquor.
