Abstract (en)

1. A process for the uniform tone-in-tone dyeing of textile woven or knit fabrics made from mixtures of cellulose fibres and synthetic polyamide fibres according to a continuous or semi-continuous method of the pad-dyeing technique from a single bath with water-insoluble azo dyestuffs formed on the fibre from coupling component and diazo component in the form of a stabilized diazonium compound, in which the dyestuff components are mutually applied under alkaline conditions and dyestuff development is caused by the action of acid, which process comprises using as the diazo component a water-soluble diazoamino compound obtained from a diazotized, aromatic or heterocyclic amine and cyanamide, padding the textile goods at temperatures ranging from 60 degrees to 70 degrees C with an aqueous, alcoholic liquor containing both of dyestuff components in dissolved form, and wherein - immediately after the padding operation but before effecting the acid treatment, which is necessary for liberating the diazonium compound and coupling - the said impregnated textile goods are steamed without intermediate drying.

Abstract (de)

Mischungen aus Cellulose- und synthetischen Polyamid-Fasern werden kontinuierlich oder halbkontinuierlich Ton-in-Ton gefärbt, wenn man das Textilgut unter alkalischen Bedingungen mit einer gelöste Kupplungskomponente sowie eine gelöste, mittels Cyanamid stabilisierte Diazonium-Verbindung enthaltenden, wäßrigen/ alkoholhaltigen Flotte von 60 - 70°C klotzt, diese noch feuchte Grundierung unmittelbar danach dämpft, und wenn man die Entwicklung des unlöslichen Azofarbstoffes auf Faser durch Säurebehandlung mit einem frischen Bad herbeiführt.
