Abstract (en)

[origin: EP0014941A1] 1. Cooled turbine or compressor housing (100), which is surrounded by a jacket (5), so that cooling gas separated from the working fluid flows through the intermediate space between jacket and fluid machine housing characterised in that a) the cooling gas inlet and outlet openings (10, 14, 12) open directly into the surroundings, so that movement of the cooling gas results only from the thermal drive of the current of cooling gas which is increasing in temperature, and b) the jacket also surrounds the overlying inlet and outlet openings (3, 4) of the fluid machine.
