Abstract (en)
[origin: GB2037333A] This device mounted in a loom, comprises a thread guide conduit (7) consisting of upper lamellae (6) and lower lamellae (19). This conduit (7) is open at the comb side (2) so that the thrown weft thread may reach the comb (2). The path of the thread is limited at the lower side of the conduit (7) by other lamellae than at the upper side. The lamellae which form the lower enveloping surface, enter the warp in other locations than the lamellae which form the upper enveloping surface.
