Abstract (en)  
[origin: EP0017024A1] 1. Circuit connector or terminal comprising a lower part (1; 101; 201; 301) and at least one transversely elastic upper part (4; 104; 204; 304) which together with said lower part forms at least one channel (7; 107; 207; 307) and which has a marginal zone (9, 9'; 109, 109'; 209, 209'; 309, 309') on each of the two sides running parallel to the channel and which can be clamped to the lower part by means of at least one screw (19; 119; 219; 319), characterised in that the two lateral marginal zones (9, 9'; 109, 109'; 209, 209'; 309, 309') are bent inwards at an angle and each has at least one bore (12; 112; 212) for the engagement of one of the screws (19; 119; 219) provided for clamping the parts together or each forms a partial boundary for one of the channels (307).
