Abstract (en)
[origin: US4325044A] A holder for retaining mirror symmetric E core halves of an electromagnetic core structure consists of angle pieces each having a leg disposed parallel to abutting sides of the E core halves and each having another leg extending around a straight outer surface of one of the halves. The parallel legs engage a retaining plate and terminate in threaded ends for receiving bolts to force the E core halves together and retain the halves by pressure exerted on the outer surfaces of the halves. The threaded ends of the angle pieces extend a sufficient distance for utilization of the holder to mount the electromagnetic core on a circuit board.
