Abstract (en)

[origin: EP0017177A1] 1. A method of twisting at least one insulated conductor (1) of an electric cable before it is stranded with analogous conductors, characterized in that the conductor is made to advance between and in contact with two rollers (2, 3) whose axes are parallel in the same vertical plane and substantially perpendicular to the direction of advance of the conductor, said rollers rotating about their axes, and at least one of them moving in alternating translations along its axis, then on a take-up unit (13, 14) which blocks the conductor in the twisted state.
