Abstract (en)

A flush water distributor for a water closet bowl is in the form of an insertable bush (1) including a cylindrical hollow body made of a resilient material. One end of the bush has an opening (3) for receiving flush water and the end region at the other end of the bush has two distribution outlet openings (12 and 13) which are arranged to direct water issuing therethrough in two streams inclined at predetermined equal angles to the central axis (9) of the bush at its outlet end. The distributor is insertable in a through opening of corresponding cross-section in the water closet bowl and flush water distribution openings therefore do not have to be provided integrally in the cast bowl.
