Abstract (en)

1. Print element actuator for a wire printer of the type including : an electro-magnet (58) and a permanent magnet, each of them having the form of a hollow cylinder, an armature (50) affixed to the print wire and positioned within said electro-magnet and said permanent magnet so that said armature can move a predetermined distance between a metal back stop (54) and a front stop (64), a first magnetic circuit, including the electromagnet, the armature and the front stop, and through which flux flows when the electro-magnet is energized, this flux controlling the forward movement of the print wire, a second magnetic circuit, including the permanent magnet and the armature and through which flux flows when the electro-magnet is not energized, this flux controlling the reverse movement of the print wire, this actuator being characterized in that : a cylindrically shaped hollow piece (76) is positioned between the electro-magnet and the permanent magnet to set up a magnetic circuit with the electro-magnet, the front stop and the armature and the backside stop is formed of a non-magnetic material.

Abstract (fr)

Dispositif de commande du déplacement d'un fil d'impression (52) comportant une armature (50) fixée à ce fil et dont le déplacement vers la butée avant (64) est commandé par le flux produit par l'électroaimant (58) lorsqu'il est excité, son déplacement vers la butée arrière (54) étant commandé par le flux produit par l'aimant permanent (56) lorsque l'électroaimant de l'aimant permanent (56) lorsque l'électroaimant n'est pas excité. Un anneau magnétique (76) sépare l'électroaimant de l'aimant permanent, cet anneau permettant de diminuer la réluctance du circuit magnétique produit par l'électroaimant. Ce dispositif est utilisé dans les imprimantes à matrice de points.
