Abstract (en)
[origin: ES8103245A1] The insulated outer coating of walls of building structures includes a cured foamed insulation material applied in a flowable state and an outer plaster means. Metal plates forming the moulding form for the injected foamed insulation material are connected by means of threaded bolts with the wall of the building structure, whereby a space is defined between the outer surface of said wall and the inner surface of each metal plate. A flowable insulation material containing urea-formaldehyde is injected into this space and cured therein. Each metal plate comprises protrusions and perforations. The perforations extend through the protrusions as well as through the metal plate. The plaster material applied on the outer face of the metal plates penetrates in its flowable state the penetrations and when cured is anchored by means of the protrusions and the penetrations. This arrangement allows the application of a not adhering or not sticking, respectively, insulation material, whereby the plaster is not carried by the insulation material but rather by the building wall itself. Conclusively, the insulation material is not subject to any forces stemming from the gravity of the plaster.

Abstract (de)
Eine Metallplatte (2) ist mit der Gebäudewand (1) unter Belassung eines Zwischenraumes verschraubt, in welchem Zwischenraum ein Urea-Formaldehyd-Schaumstoff (11) angeordnet ist. Die Metallplatte (2) weist Vorsprünge (8) mit Löchern (9) auf. Der auf der Metallplatte (2) aufgetragene Verputz (10) ist durch die Vorsprünge (8) und Löcher (9) mit der Metallplatte (2) verankert. Die isolierte Außenbekleidung für Gebäudewände ermöglicht das Anbringen eines nicht haftenden Isolierstoffes an eine Gebäudewand, wobei der Verputz nicht von Isolierstoff, sondern von der Gebäudemauer getragen ist, derart, daß der Isolierstoff keinen vom Gewicht des Verputzes berührenden Kräften ausgesetzt ist.
