Abstract (en)
[origin: EP0020014A2] The moulded building shed has opposed side edges of increased thickness with respect to the general thickness of the sheet. The thicker edges each accommodate a rebate which extends along the respective side edges and into which the free ends of reinforcing wires project. The rebates and projecting portions of the wires together form joints for joining adjacent sheets together, the wires of one sheet been twisted into engagement with the wires of the other sheet. Preferably two building sheets are joined together by spacers to form a composite building panel.
