Abstract (en)  
[origin: EP0021088A2] An ergonomic medical requirement for avoiding unnecessary loads during sedentary work is fulfilled by the adaptability to the user of the working and seat surface height. According to the invention this is achieved in that the part (9), which is adjustable in height, is provided with an automatically operating height-adjustment device which can be controlled from an input part (14) in such a way that, on input of the height of the respective user, the part (1), which is adjustable in height, can be adjusted or reset automatically to the most favourable height in accordance with ergonomic viewpoints. <IMAGE>
