Abstract (en)

[origin: EP0022291A1] 1. Process for the dosing of products that are difficult to fill into packages, for example foodstuffs such as blanched spinach, endive, sliced green beans, vegetable mixes, noodle mixes etc., into portions of uniform weight, in which the products to be packaged from a storage container are formed into a compressed column, are pushed into a dosing chamber of a volumetric dosing device and are divided into separate portions, characterized in that the compression of the column is effected by compressing it several times transversely to its axis, the column during or at the end of the compression being conveyed positively downwards and the lateral pressure on the column being only removed after the latter step.
