Abstract (en)

[origin: WO8001449A1] Filing cabinet having drawers (10) arranged between two of its vertical walls (12), it being possible to pull out said drawers completely in a horizontal direction using telescoping rails (14, 16) being movable relative to the drawer as well as the walls. These rails interact with guide faces formed in one piece with the drawer (10), said guide faces being formed by two horizontal flanges (22, 24) protruding from the side edges of the drawer so that said side edge (18, 20) is U-shaped in cross section. The guide faces in the walls of the cabinet are formed by separate skid rails (50, 52) being fitted into spaces formed by lists (40-48) protruding from said walls (12) and being shorter than the telescoping rails (14, 16). The design of the side edges of the drawer makes it possible to move the drawer, sliding in two grooves formed in each skid rail without the use of intermediate telescoping rails.
