Abstract (en)

For the purpose of dispensing documents from a store (11, 12..14) there is provided a dator processor (10) for controlling said dispensing operation, a document conveyor path (15, 16, 17, 18, 19, 201-202) arranged to pass said documents to an outfeed compartment; a detecting means (19) for checking the documents; and switching means for switching the conveyor path to the outfeed compartment (21) or to a return compartment (22). The dator processor is provided with information concerning a first signal which is individual for documents from respective stores, and the detector means (19) is arranged to deliver a second signal in dependence on a document passing said means. The dator processor (10) has a memory (24) to which information concerning the first signal is fed and which is connected either to a control circuit (25) connected between the detecting means (19) and a comparison circuit (23), or to said comparison circuit (23). The comparison circuit compares the second signal with a value in the circuit (23), whereat both the signal and the value in the circuit are dependent on the first signal and control the switching means in response to the result of the comparison made.
